1

## Key Takeaways

Item	Takeaway
Basic principle and scope	<ul style="list-style-type: none"><li>■ "Case-by-case" concept should be preserved.</li><li>■ Bioconjugates are a new category of S6 and need specific considerations.</li><li>■ Antisense and RNAi are out-scope of S6.</li></ul>
Species selection	<ul style="list-style-type: none"><li>■ Transgenic animals and homologous proteins could be an alternative, however, there are limitations.<ul style="list-style-type: none"><li>■ Safety margin, validation, historical data, not final product and different pharmacology</li></ul></li><li>■ Homologous proteins seem to be more useful alternative than transgenic animals.</li></ul>

## Key Takeaways (Cont'd)

Item	Takeaway
Dose selection	<ul style="list-style-type: none"><li>■ MABEL would be an option to predict starting dose for FIH from preclinical information.<ul style="list-style-type: none"><li>■ One should note that a too conservative approach would result in slow down of the development of biopharmaceuticals<ul style="list-style-type: none"><li>■ NOAEL approach has been appropriate for most cases.</li></ul></li></ul></li></ul>

## Key Takeaways (Cont'd)

Item	Takeaway
Repro/dev tox	<ul style="list-style-type: none"><li>■ Monkey repro/dev tox studies are feasible and meet regulatory requirement, although there are some technical difficulties.</li></ul>
HERG assay	<ul style="list-style-type: none"><li>■ Most biopharmaceuticals may not block potassium channel because of the failure of penetration of the molecule into cell inside<ul style="list-style-type: none"><li>■ Some proteins/peptides are reported to inhibit HERG current through binding to toxin binding site or stimulating superoxide, however, these may not be the cases for biopharmaceuticals.</li></ul></li><li>■ If QT prolongation is observed in an <i>in vivo</i> study, an <i>in vitro</i> study including HERG should be considered.</li></ul>

## Key Takeaways (Cont'd)

Item	Takeaway
Genotoxicity testing	<ul style="list-style-type: none"><li>■ Genotoxicity risk should be assessed for bioconjugates with a chemical organic linker.<ul style="list-style-type: none"><li>■ If no degradation of a bioconjugate occurs or if there is a precedent of the use of a linker, genotoxicity studies may not be needed.</li></ul></li></ul>

5

## Key Takeaways (Cont'd)

Item	Takeaway
Carcinogenicity studies	<ul style="list-style-type: none"><li>■ Carcinogenicity assessments need to be based on a scientific cause for concern.<ul style="list-style-type: none"><li>■ Pharmacology, data from chronic studies, patient population</li></ul></li><li>■ Alternative approaches (e.g. a chronic tox study in a relevant animal) are useful and justified in many cases.<ul style="list-style-type: none"><li>■ A 2-year rodent bioassay should not be an expectation.</li><li>■ Histopathological examination of proliferative changes such as PCNA is recommended.</li><li>■ <i>In vitro</i> proliferative assays are useful.</li></ul></li></ul>

## Conclusion

---

- ICH S6 guideline should be updated to reflect accumulated experience of biopharmaceuticals and advanced scientific knowledge.
- The contents discussed in this forum are areas for the update.
