The Mechanism for triggering of Ca²⁺ release from the sarcoplasmic reticulum and the functional significance of the endocardial endothelium were compared between atrial and ventricular myocardia. The early phase Ca²⁺ transients in cardiomyocytes were visualized with rapid-scanning confocal microscopy. The difference of the response to various transmitters and pharmacological agents are compared between atrial and ventricular myocardia. From the results, the influence of T-tubules and endocardial endothelium on E-C coupling and inotropy is discussed.

Key words: calcium, cardiomyocyte, EC-coupling
